Excerpt from Ensilage of Green Crops: From the French of Auguste Goffart, With the Latest Facts Connected With This System Rains, oftentimes prolonged, coming upon the harvest, the absence of sufficient heat in autumn, are powerful causes of deterioration of hay. What agriculturist has not seen a hundred times his hay, injured by rain, deprived of its richest and most assimilative elements? The rain prolonged, the hay is invaded by a species of nauseous rot, which disgusts cattle and causes formidable maladies when hunger forces them to eat it. If these things occur to the common fodder crops-clover, lucern, sainfoin, etc. - what would happen to the fodder crops of high growth and great yield, such as maize and sorgho? Never in temperate climate could we obtain for these a sufficient desiccation by the sun. About the Publisher Forgotten Books publishes hundreds of thousands of rare and classic books.
