Excerpt from Division of Cancer Biology and Diagnosis, Annual Report, Vol. 2: Extramural Research Program; October 1, 1983-September 30, 1984 Research in identifying and characterizing oncogenes has progressed at a rapid pace in the last year, as evidenced by the expanded list of oncogenes that have been discovered and the remarkable findings identifying previously unsuspected biological activities of some oncogene products. This information is summarized in the adjoining table. Many of the original observations suggesting tissue specificity for oncogene expression have not been confirmed, but most of the fundamental criticisms questioning the validity of oncogene assay systems have been allayed. Now it is possible to form hypotheses of how oncogenes are activated to produce transformed cellular growth. An important fact to emphasize, however, is that oncogene research has been entirely focused on genes which contribute to uncontrolled growth phenomenon. No studies in this area have addressed later events in tumor progression which lead to cellular invasion and metastasis.
