15N-NMR SPECTROSCOPY NMR BASIC PRINCIPLES AND PROGRESS

Springer. Paperback. Condition: New. 384 pages. After the proton and carbon, nitrogen is, with oxygen, the most important atom in organic and especially bioorganic molecules. However, the development of nitrogen spectroscopy is indeed very recent. This is due to the fact that nitrogen-14, which is the naturally abundant isotope, suffers, for structural studies, from the disadvantages inherent in nuclei with a quadrupolar moment (Table 1. 1). Actually, indirect ^{15}N measurements were reported in the early days of double resonance spectroscopy and the first direct detection of ^{15}N resonance signals at the natural abundance level was realized in 1964 (R 17) at 4. 33 MHz (1 T) using a 15 mm o. d. cell in the field sweep mode (0. 16 min-). Signal-to-noise ratios only of 3-4 were obtained for neat liquids and this low sensitivity of the ^{15}N resonance still remains the main disadvantage for ^{15}N spectroscopy (Table 1. 1). However, nitrogen-15 has, N probably more than any other nucleus, benefited from the advances of NMR technology, i. e. Fourier transformation, multinuclear facilities, wide-bore superconducting solenoids, and, with the new generation of spectrometers, ^{15}N -NMR is entering the field of routine investigation. Nevertheless, in spite of these spectacular improvements, obtaining ^{15}N spectra of diluted species or large biochemical molecules is often not very easy and a good knowledge of the relaxation properties peculiar to ^{15}N may be necessary in order to adjust the pulse sequences and the decoupler duty cycle correctly (Section 2). This item ships from multiple locations. Your book may arrive from Roseburg, OR, La Vergne, TN. Paperback.
