The hydrodynamic force on a cylinder oscillating transversely to its axis is a nonlinear function of the displacement amplitude x_0 . We report measurements and numerical calculations of the force at frequencies low enough that $\delta \ll R$, where δ is the viscous penetration length and R is the cylinder radius. For small amplitudes, the numerically calculated Fourier transform of the force per unit length, $F(\text{small})$, agrees with Stokes analytical calculation. For larger amplitudes, the force per unit length found by both calculation and measurement is $F(\text{small})C(x_0/\delta, R/\delta)$. The complex function C depends only weakly on R/δ , indicating that x_0/δ is more appropriate as a scaling variable than the Keulegan-Carpenter number $KC = \omega x_0/R$. The measurements used a torsion oscillator driven at frequencies from 1 to 12 Hz while immersed in dense xenon. The oscillator comprised cylinders with an effective radius of $R = 13.4 \mu\text{m}$ and oscillation amplitudes as large as $x_0/\delta = 4$ (corresponding to KC as large as 71). The calculations used similar conditions except that the amplitudes were as large as $x_0/\delta = 28$. This item ships from La Vergne, TN. Paperback.
