

A Reformulation-Linearization Technique for Solving Discrete and Continuous Nonconvex Problems (Hardback)

Filesize: 6.26 MB

Reviews

Thorough manual for pdf lovers. I am quite late in start reading this one, but better then never. It is extremely difficult to leave it before concluding, once you begin to read the book.

A REFORMULATION-LINEARIZATION TECHNIQUE FOR SOLVING DISCRETE AND CONTINUOUS NONCONVEX PROBLEMS (HARDBACK)

Springer, Netherlands, 1998. Hardback. Condition: New. 1999 ed.. Language: English . Brand New Book ***** Print on Demand *****.This book deals with the theory and applications of the Reformulation- Linearization/Convexification Technique (RL T) for solving nonconvex optimization problems. A unified treatment of discrete and continuous nonconvex programming problems is presented using this approach. In essence, the bridge between these two types of nonconvexities is made via a polynomial representation of discrete constraints. For example, the binariness on a 0-1 variable x can be equivalently expressed as the polynomial constraint $x \cdot (1-x) = 0$. The motivation for this book is the role of tight linear/convex programming representations or relaxations in solving such discrete and continuous nonconvex programming problems. The principal thrust is to commence with a model that affords a useful representation and structure, and then to further strengthen this representation through automatic reformulation and constraint generation techniques. As mentioned above, the focal point of this book is the development and application of RL T for use as an automatic reformulation procedure, and also, to generate strong valid inequalities. The RLT operates in two phases. In the Reformulation Phase, certain types of additional implied polynomial constraints, that include the aforementioned constraints in the case of binary variables, are appended to the problem. The resulting problem is subsequently linearized, except that certain convex constraints are sometimes retained in particular special cases, in the Linearization/Convexification Phase. This is done via the definition of suitable new variables to replace each distinct variable-product term. The higher dimensional representation yields a linear (or convex) programming relaxation.
