Createspace Independent Publishing Platform, United States, 2017. Paperback. Condition: New. Language: English . Brand New Book ***** Print on Demand *****. This book is a historical accounting of Canada's RD programs in infrared signature suppression (IRSS) for military platforms, particularly warships and tactical helicopters. The RD program that took place at Defence Research Establishment Suffield (DRES) between 1975 and 1980 is detailed. The Canadian Navy was preparing to build new City class patrol frigates and to refit existing Tribal class DDH-280 destroyers at the time. The most significant infrared (IR) emitter on a warship is the hot engine exhaust ducts. An IRSS system capable of preventing heat-seeking missiles from detecting warships was invented. The DRES Ball is a cooled exhaust system with optical blockage. It was patented in 1982 and later licensed to W.R. Davis Engineering Limited (Davis). The DRES Ball was installed on all Canadian Patrol Frigates and a light-weight variant, known as the Eductor/Diffuser, was installed on all DDH-280 destroyers. Both maritime systems were adapted for use on tactical helicopters and 30 Canadian CH-146 Griffon helicopters are fitted with these systems today. Davis was involved in all of this work under contracts with the Canadian Department of National Defence (DND) in which DND retained ownership of all intellectual property (IP). Software dubbed ShipIR was developed to model the IR signature of warships beginning in 1992. A module known as the Naval Threat Countermeasures Simulator (NTCS) was also developed capable of modelling the engagement between a warship and an incoming IR-guided missile. ShipIR/NTCS was developed by Davis under contracts with DND. It has been the NATO standard software for IR studies for the last two decades. Having addressed the most significant IR emitters on warships, attention turned to the problem of IR radiation from sun-heated surfaces...
