Excerpt: . . . we have the equation of the conic of five pointic intersection at the point (ft). The result in its reduced form may be obtained directly without much difficulty, but it is obtained most easily as follows: let the function on the left-hand of the foregoing equation be represented by a, b, c, f, g, h ($r, j, ,$) then writing $x: y: z = 1: 8: 83$, we have (a, b, c, f, g, h) (1, 8, S) 1958. (Proposed by J. Gbippiths, M. A.)—Let P denote a point in the plane of a given triangle ABC ; $a, 0, 7$ the feet of the perpendiculars drawn from P upon the sides BC, CA, AB . Then if the triangle 07 is homologous with the given one ABC , the locus of P is a cubic which passes through (1) the angular points of the triangle; (2) the centres of the inscribed and escribed circles; (3) the point of intersection of the three perpendiculars; (4) the centre, O , of the circumscribing circle; (5) the points L, M, N , where the radii AO, BO, CO produced meet this circle again. Moreover, if V denote the inverse of P with respect to the sides of the given triangle, show that P also lies on the cubic-locus in question. I. Solution by J. Dale; and others. Let r, y, z be the coordinates of P , the equations of $Aa, B3, Oy$ will be $0 - \cos A \cos B$ and these...
