A thin straight tube revolves with a given angular velocity about a vertical axis through its lower end, which is fixed, the inclination of the tube to that axis being invariable. Determine the condition of equilibrium of a particle placed at a given point within the tube, supposing it to be (1) smooth, (2) rough. Let α = the inclination of the tube to the vertical axis, a = the distance of the particle from the axis, ω = the angular velocity. The effect of the rotation is to produce an acceleration $\omega^2 a$ perpendicular to the axis, and from it, the resolved parts of which parallel and perpendicular to the tube are $\omega^2 a \sin \alpha$, $\omega^2 a \cos \alpha$, respectively. Hence,...
