Let us look more carefully into this question. Suppose the line AB (Fig. 513) contains 3 units of length, and suppose that a point P travels from A to B. Then we conceive the distance AP as increasing continuously from zero to 3 units: that is to say, the distance AP passes through all possible magnitudes between zero and AB; and yet if we use only the arithmetical concept of number we have no means of expressing the distance AP accurately in terms of the unit of length whenever P is in such a position that AP is incommensurable to the unit of length. Accordingly we require somehow to extend our conception of number in such a way that number (like magnitude) may be supposed to increase continuously from any one value to any other. Thus we must assume that numbers exist which cannot be accurately expressed by integers or fractions, and that any two incommensurable quantities have a ratio expressed by means of such a number. 377. Irrational Numbers.--All numbers which can be expressed by integers or fractions (proper or improper) are called rational numbers, and all numbers which cannot be so expressed are called irrational. The object of this chapter is to give a logical account of irrational numbers. It will be necessary--(i) to explain how an irrational number...
