Rarebooksclub.com, United States, 2012. Paperback. Book Condition: New. 246 x 189 mm. Language: English . Brand New Book ***** Print on Demand *****.This historic book may have numerous typos and missing text. Purchasers can download a free scanned copy of the original book (without typos) from the publisher. Not indexed. Not illustrated. Excerpt: .bitumen was then determined gravimetrically after removal of free sulfur. Free sulfur constituted a variable amount of the benzene-soluble fraction, ranging from 0 to 88 percent and averaging about 25 percent of the total benzene extract; the results underscore the fact that free sulfur must be removed in order to obtain a reliable bitumen value. Free sulfur was removed from the bitumen extract and semiquantitatively determined by a chromatographic technique in which powdered copper amalgam was used as the adsorptive medium--a method suggested by B. D. McIver of Esso Production Eesearch Co., Houston, Tex. (written commun., 1966). Although it is assumed that most of the sulfur determined by this method is free sulfur, some organic sulfur compounds also were probably removed by this technique and included as free sulfur. The method of extraction of alkaline-soluble humic substances is similar to that described by Palacas, Swanson, and Moore (1966, p. C103), except for modifications described below. Extraction with 0.17N NaOH, using a solvent-to-sample ratio between 10:1 and 15:1, was made by subjecting the sediment to 24 hours of shaking instead of 8 hours, and keeping the sample under nitrogen to prevent oxidation. Two additional i/-hour extractions by mechanical shaking were sufficient to remove 90 to 95 percent of the soluble humic matter. The alkaline-soluble humic matter was then divided into humic acid and fulvic acid fractions by utilizing their solubility differences. By lowering the pH of the alkaline solution to about 1, a heavy dark-brown precipitate, designated as...
