Not illustrated. 1900 Excerpt: . . . its atomic mass divided by its valence in the compound electrolyzed. Thus, let q stand for the quantity of electricity which passes any point of the circuit, m the total mass liberated, A the atomic mass of the ion, and V its valence. Then (4) $m = kq$, where k is a constant depending only on the units employed. If t denote the time of flow of the steady current i , equation 4 may be written $kA = zt$, kA by writing e . e is called the electro-chemical equivalent. It is found by experiment that one ampere, flowing for one second, deposits 0.001118 g. of silver. Taking the atomic mass of silver as 108, that is, 0.16, the value of k is found to be 1.035(10), from which the electro-chemical equivalents of the other elements may be calculated. Thus, by equation 5, if the atomic mass of copper be taken as 63.64, and its valence as 2, the electro-chemical equivalent of copper is $e = 0.0003294$. 1 ampere 1 sec. 356. Theory of Electrolysis. --The facts of electrolysis are best accounted for by the theory originally proposed by Grotthuss and developed by Clausius. Each molecule of an electrolyte is assumed to be composed of two parts which are oppositely charged, and united by certain bonds usually designated as chemical. These parts may consist either of single atoms as in HCl , or of a group of atoms, which in many...
