Microsurgical Neuro-Vascular Anastomoses for Transplantation of Composite Bone and Muscle Grafts An Experimental Study

By H. M. Tschopp

Springer. Paperback. Condition: New. 64 pages. Dimensions: 11.0in. x 8.3in. x 0.1in. The thrust forward into small dimensions with the aid of high magnification (6-40 power) under the operating microscope marks an important development in almost all fields of surgery. Neurosurgery, ophthalmology and otorhinolaryngology have already integrated the binocular microscope as an indispensable tool into their armamentarium. General surgery is also making increasing use of it—as is the case with transplantations of autogenous free intestinal grafts. A great victory march of microsurgery, however, appears to be taking place in plastic and reconstructive surgery. Reimplantation of arms, hands, and especially digits are hardly thinkable today without the possibility of high magnification. New microsurgical anastomosing techniques (interfascicular neurorrhaphy) have also improved the functional results after nerve injuries. Time-consuming reconstructive procedures, such as the transfer of a distant flap with its physical and psychological burden, are being increasingly replaced by free flaps transplanted by microvascular suture techniques—the most popular free flap being the groin flap in which the superficial circumflex iliac artery and vein is reanastomosed to the recipient vessels. Nevertheless, the writer was sceptical when Dr. TSCHOPP set about with his ambitious plan to transplant a free autogenous...
