Rarebooksclub.com, United States, 2012. Paperback. Book Condition: New. 246 x 189 mm. Language: English . Brand New Book ***** Print on Demand *****.This historic book may have numerous typos and missing text. Purchasers can download a free scanned copy of the original book (without typos) from the publisher. Not indexed. Not illustrated. 1879 Excerpt: .give $m = -2.784$ $r_a = 94.377 - 4.517 w_a = 0.3863$ and by means of equations (100), (102), (103) and (104) of 29 it is easy to calculate T , Q_0 , Q and AV_r . The results of these calculations are recorded in the following table, which gives the negative heat obtained, the work absorbed and the performance per cubic meter of sulphur dioxide, supposing the apparatus regulated for a temperature of -124.1 in the refrigerant, and that the temperature of the interior of the condenser varies from $+15$ to $+40$: We see that the performance diminishes more than one-half when the temperature of the interior of the condenser rises from 15 to 40 . The figures of the last column do not nearly represent the number of calories really produced and utilized. It is necessary to take into account the loss occasioned by the pipes; the waste spaces in the cylinder; of loss of time in opening of the valves; of the leakage around the piston and valves; of the reheating by the external air; and finally, when ice is being made, of the quantity of the ice melted in removing the blocks from their molds. It requires about 100 calories to congeal to -7 a kilogram of water taken at 15 or 16 . Manufacturers estimate that practically the sulphur dioxide apparatus using water at 12 or 13 , produces 25 kilograms of ice, or 2,500 calories per horse power per hour, measured on the driving shaft, which is about 55 per cent, of the theoretic efficiency indicated...
