

A Method for Quantitative Mapping of Thick Oil Spills Using Imaging Spectroscopy: Open-File Report 2010-1167

Filesize: 1.37 MB

Reviews

It is really an awesome ebook that we actually have actually study. It can be loaded with wisdom and knowledge Once you begin to read the book, it is extremely difficult to leave it before concluding.

(Mr. Coleman Ortiz)

A METHOD FOR QUANTITATIVE MAPPING OF THICK OIL SPILLS USING IMAGING SPECTROSCOPY: OPEN-FILE REPORT 2010-1167

To get **A Method for Quantitative Mapping of Thick Oil Spills Using Imaging Spectroscopy: Open-File Report 2010-1167** PDF, remember to follow the button listed below and save the document or get access to other information that are highly relevant to **A METHOD FOR QUANTITATIVE MAPPING OF THICK OIL SPILLS USING IMAGING SPECTROSCOPY: OPEN-FILE REPORT 2010-1167** book.

Bibliogov, United States, 2013. Paperback. Book Condition: New. 246 x 189 mm. Language: English . Brand New Book ***** Print on Demand *****.In response to the Deepwater Horizon oil spill in the Gulf of Mexico, a method of near-infrared imaging spectroscopic analysis was developed to map the locations of thick oil floating on water. Specifically, this method can be used to derive, in each image pixel, the oil-to-water ratio in oil emulsions, the sub-pixel areal fraction, and its thicknesses and volume within the limits of light penetration into the oil (up to a few millimeters). The method uses the shape of near-infrared (NIR) absorption features and the variations in the spectral continuum due to organic compounds found in oil to identify different oil chemistries, including its weathering state and thickness. The method is insensitive to complicating conditions such as moderate aerosol scattering and reflectance level changes from other conditions, including moderate sun glint. Data for this analysis were collected by the NASA Airborne Visual Infrared Imaging Spectrometer (AVIRIS) instrument, which was flown over the oil spill on May 17, 2010. Because of the large extent of the spill, AVIRIS flight lines could cover only a portion of the spill on this relatively calm, nearly cloud-free day. Derived lower limits for oil volumes within the top few millimeters of the ocean surface directly probed with the near-infrared light detected in the AVIRIS scenes were 19,000 (conservative assumptions) to 34,000 (aggressive assumptions) barrels of oil. AVIRIS covered about 30 percent of the core spill area, which consisted of emulsion plumes and oil sheens. Areas of oil sheen but lacking oil emulsion plumes outside of the core spill were not evaluated for oil volume in this study. If the core spill areas not covered by flight lines contained similar amounts of oil and...
