Rarebooksclub.com, United States, 2013. Paperback. Book Condition: New. 246 x 189 mm. Language: English . Brand New Book ***** Print on Demand *****.This historic book may have numerous typos and missing text. Purchasers can usually download a free scanned copy of the original book (without typos) from the publisher. Not indexed. Not illustrated. 1900 edition. Excerpt: . In the dorsal view (Fig. 5) it will be observed that a lateral expansion has taken place both caudad and cephalad to the deep constriction (/). The expansion involves segments 6 and 7 and occurs also in the chick. The limits of the five anterior segments were marked by both external and internal transverse grooves and these segments could therefore be clearly counted. Since segments 2 and 3 are reciprocally wedge-shaped their relative width in a dorsal view depends upon the optic plane in which they are observed. The camera tracing of Fig. 5 is taken from a median horizontal plane, and segments 2 and 3 are therefore equal in size. As can be seen in the profile views, the embryos at this age are curved ventrally to conform to the spherical yolk upon which they rest. Fig. 5 was sketched from two points of view. A camera tracing was first made of that portion of the head in front of the cerebellum. The embryo was then rotated, till the line of vision formed a right angle with the horizontal plane of the medulla and another sketch made and attached to the former. Fig. 5 thus represents the cephalic end, not curved, but straightened. Fig. 5 should be compared with Fig. 7, which shows the dorsal view of a living embryo, 26 days old, as seen from one point of view only. In the latter, the medulla is very much fore-shortened, and...
