Again PN: BC: : pn: be AN: AC: : an: ac AN: AC: : an: ac Hence pn²: an. an: be²; ac² Therefore apa is an ellipse. Q. E. D. 195. Cor. --An ellipse can be projected into a circle by properly choosing the plane of projection. For describe a semicircle on AC in a plane perpendicular to the plane of the ellipse, and place in it a line CE equal to CB; then if we take a plane parallel to BEB as plane of projection, the line AC will project into a line equal to CE or CB, while the length of CB remains unchanged. Conversely, in the same manner as in Prop. 3, the projection of a circle is an ellipse. PROP. 4. 196. The projection of a parabola is a parabola. For all the ordinates (being parallel lines) project in the same ratio, so also do all the absciss. But in the original curve the square of the ordinate varies as the abscissa, whence this relation holds also in the projected curve, which is therefore a parabola. 197. Also, by a proof similar to that given for an ellipse, any hyperbola may be projected into an hyperbola, with its axes in any given ratio, and, as a special case, into a rectangular hyperbola. 198. A diameter of a circle...
