

AIDS and Pancreas in the HAART Era A Cross Sectional Study

Filesize: 3.39 MB

Reviews

It is fantastic and great. It usually will not charge an excessive amount of. Once you begin to read the book, it is extremely difficult to leave it before concluding.

LAP LAMBERT Academic Publishing. Paperback. Condition: New. 76 pages. Dimensions: 8.7in. x 5.9in. x 0.2in. This study aims to identify the main morphological patterns of pancreas in AIDS patients using Highly Active Antiretroviral Therapy (HAART). We compared adults who died of AIDS using HAART and underwent autopsy with 109 AIDS patients without HAART therapy. The HAART group presented lighter pancreas abnormalities than non-HAART users. In the HAART group, histology shows: reduction of zymogen granules in the acinar cells (ZG), lower dysplasia-like and higher pancreatic acinar atrophy. The exocrine pancreas in treated patients was distinguished by the high level of atrophy, sharp reduction of zymogen granules and high level of apoptosis, reflecting degeneration and lower level of protein-caloric malnutrition. The islets of Langerhans in the HAART group were increased in number and volume and with a high level of nuclear dysplasia. The antiretroviral therapy and a longer survival resulted in a higher atrophy and reduction of enzymes, increasing the apoptosis and generated important changes in the pancreatic islets, probably resulting in clinical-laboratory repercussions. We found no evidence of pancreatic histological lesions secondary to antiretroviral therapy. This item ships from multiple locations. Your book may arrive from Roseburg, OR, La Vergne, TN. Paperback.
