It is fantastic and great. It is written in easy words and phrases instead of confusing. I am just delighted to explain how this is actually the best book I have got read through during my individual life and might be the finest publication for ever.

Excerpt from Report of a Two Day Underwater Survey of Selected Historical Sites at Apostle Islands National Lakeshore With Considerations for Research, 1982 The Apostle Islands are remnants of Pleistocene glaciation activity. The underlying strata is a 500 million - year - old brown sandstone upon which glacially deposited soils and gravels lay. The vegetation consists primarily of broadleaf and coniferous species and has been termed northern mesic forest. The soils are mixed and range from heavy clay with little drainage to well drained sandy areas. Beach materials are primary glacial lake beach sands reduced from the sandstone strata. Submerged bottomlands were sandy and solid in the areas emined. Water clarity is good with visibility during the survey ranging from 30 to 50 feet.
