CHARACTERISTICS OF RADIATION PYROMETERS (CLASSIC REPRINT) (PAPERBACK)

Forgotten Books, United States, 2016. Paperback. Condition: New. Language: English . Brand New Book ***** Print on Demand *****. Excerpt from Characteristics of Radiation Pyrometers A Fery mirror pyrometer, however, calibrated at temperatures in the region 500 to 1500 C could not be used to determine the apparent temperature of the sun, for example, without a careful consideration of the corrections for the selective reflection of the gold, because the maximum portion of the solar energy is confined to the region of the selectivity of gold. The apparent temperatures measured would be far smaller than the true apparent temperatures. Even at a temperature of the black body of 4000 C the gold mirror reflects but 87 per cent of the total energy falling upon it, and from the slope of the curve of Fig. 5 it is seen that at the sun's temperature (say 6000 C) the reflection coefficient will be somewhere in the neighborhood of 60 to 70 per cent. A reflection coefficient of 68 per cent means an error in temperature measurement of some 500 at 6000 C. Without doubt a silver or platinum mirror would be found much more satisfactory than the gold mirror for these high temperatures, but even these materials could not be used without applying large corrections.
